

Aircraft marker mapping

Aircraft Icon Mapping

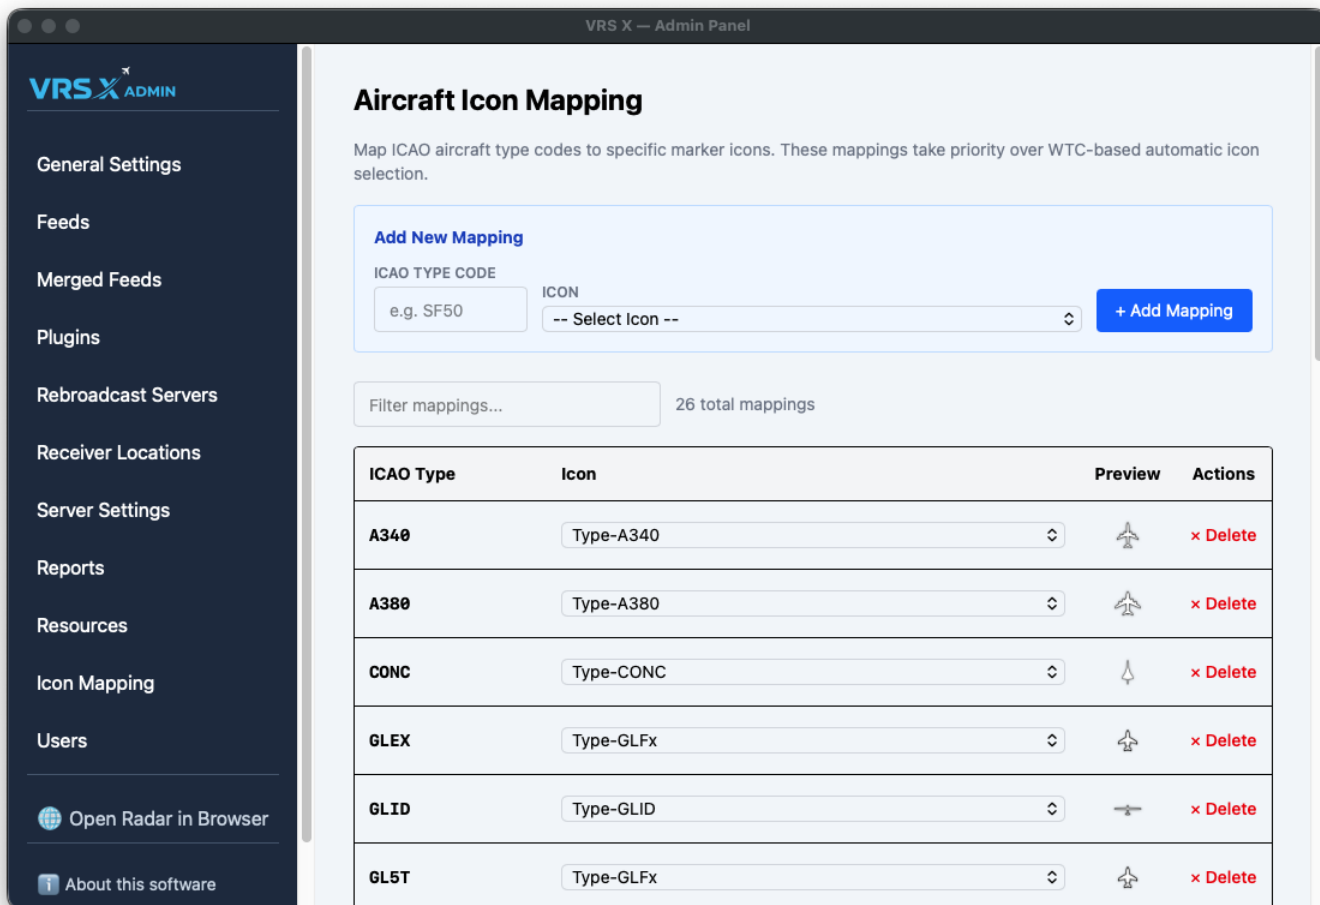

While VRS X features an intelligent automatic icon selection based on Weight Turbulence Category (WTC), you can manually override these defaults for specific aircraft. This allows you to assign dedicated silhouettes to your favorite or most common aircraft types.

How it Works

Manual mappings are the highest priority in the rendering engine. If an ICAO code is defined here, its assigned icon will **always** take priority over WTC-based automatic selection.

Adding a New Mapping

1. Navigate to the **Icon Mapping** section in the sidebar.
2. Under **Add New Mapping**, enter the **ICAO TYPE CODE** (e.g., `B748`, `A35k`, or `GLID`).
3. Select the desired **ICON** from the dropdown menu.
4. Click **+ Add Mapping**.
5. Click **Save Mapping** and refresh VRS X radar page.

Managing Your Icons

The mapping table provides a clear overview of your custom silhouettes:

- **Filter:** Quickly search through your mappings using the filter box (useful when you have dozens of custom icons).
- **Preview:** See the actual marker silhouette in the **Preview** column before it hits the live map.
- **Actions:** Easily remove a mapping by clicking **x Delete** if you want to revert to automatic WTC selection for that type.
